Spatial delineation of cropping systems

Rainer Baritz [rainer.baritz@bgr.de]
Michael Fuchs [michael.fuchs@bgr.de]

Combined types of crops derived from monitoring data

Objectives

- ** to improve data input to agro-economic models
 - * to regionally stratify the cropland area (rainfed arable land)
 - * to detect cropping pattern, to refine the mapping of crops
(against CORINE using Lucas)

Combined types of crops derived from monitoring data

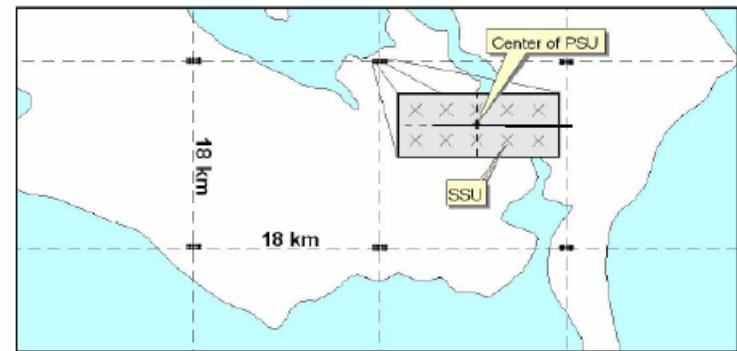

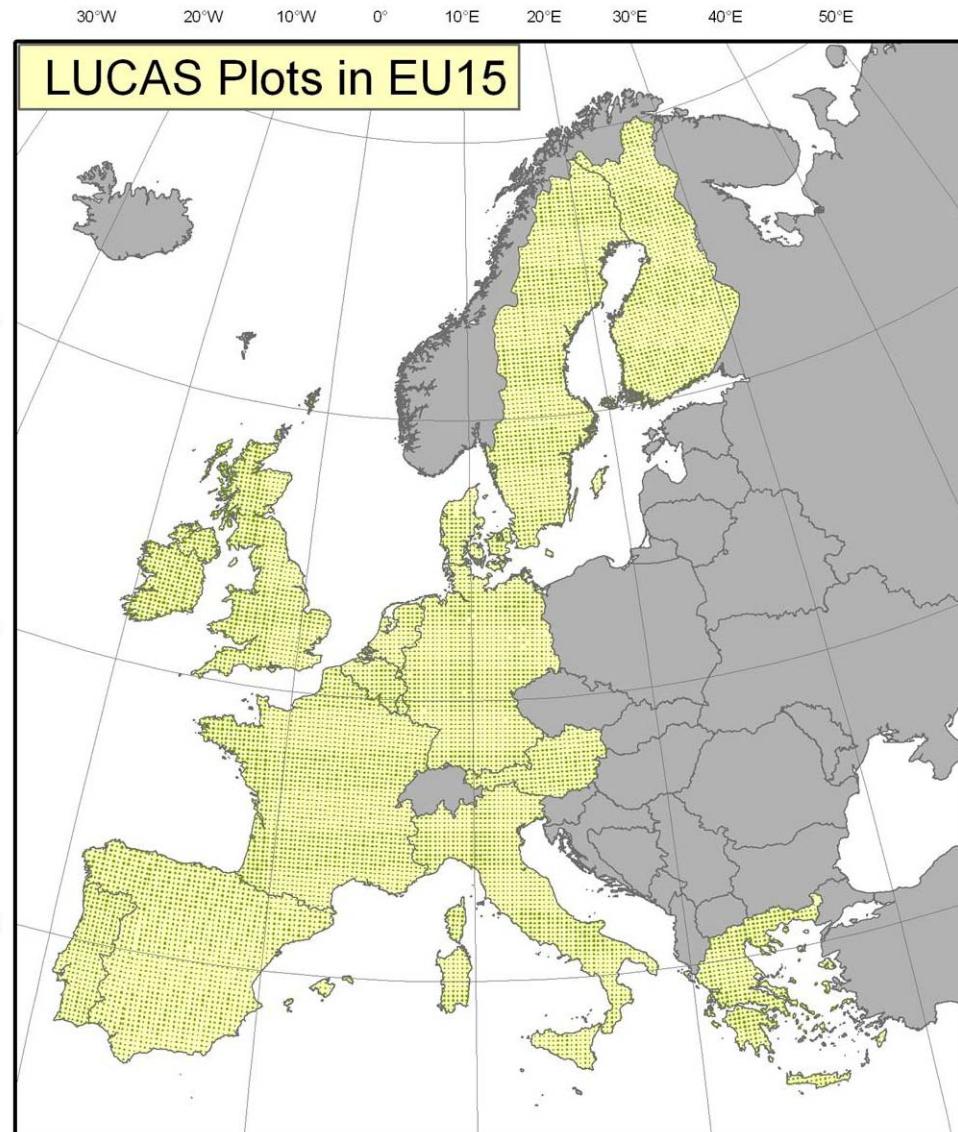

Rationale

- * Land use systems are mostly controlled by management
- * Land use systems are temporal and spatial systems
- * Relation between number of crops and yield exists
- * Crop shares mainly depend on climatic conditions

Combined types of crops derived from monitoring data

Data basis

LUCAS phase 1 EU15, 2003

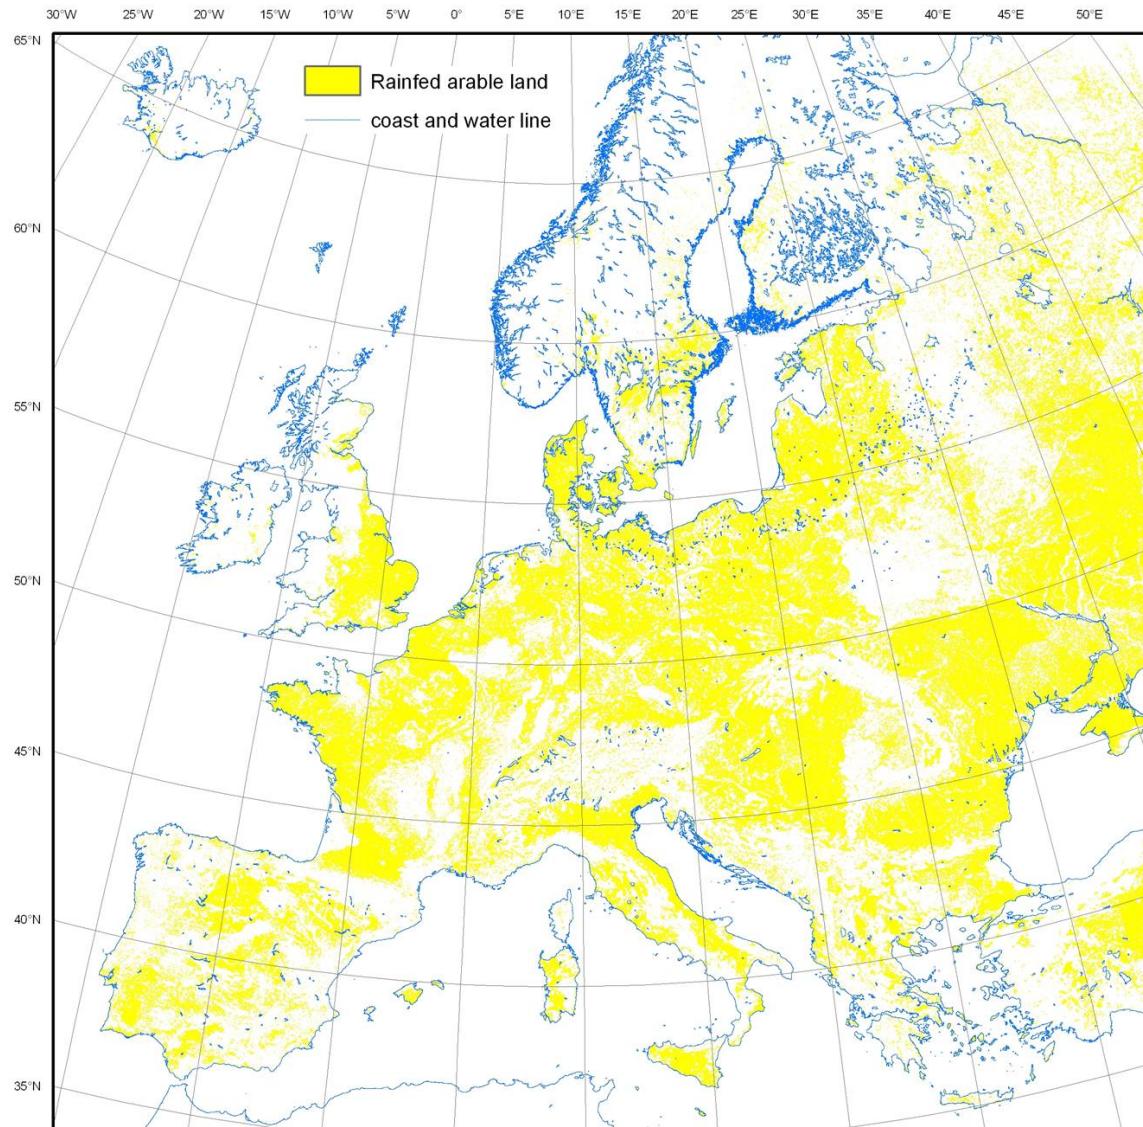

Country	Number of PSU	Number of SSU
Austria	AT	255
Belgium	BE	100
Germany	DE	1105
Denmark	DK	147
Spain	ES	1268
Finland	FI	1073
France	FR	1702
Greece	GR	419
Ireland	IE	218
Italy	IT	941
Luxembourg	LU	8
The Netherlands	NL	117
Portugal	PT	277
Sweden	SE	1407
United Kingdom	UK	775
EU15		9812
		96633

Combined types of crops derived from monitoring data

Data basis

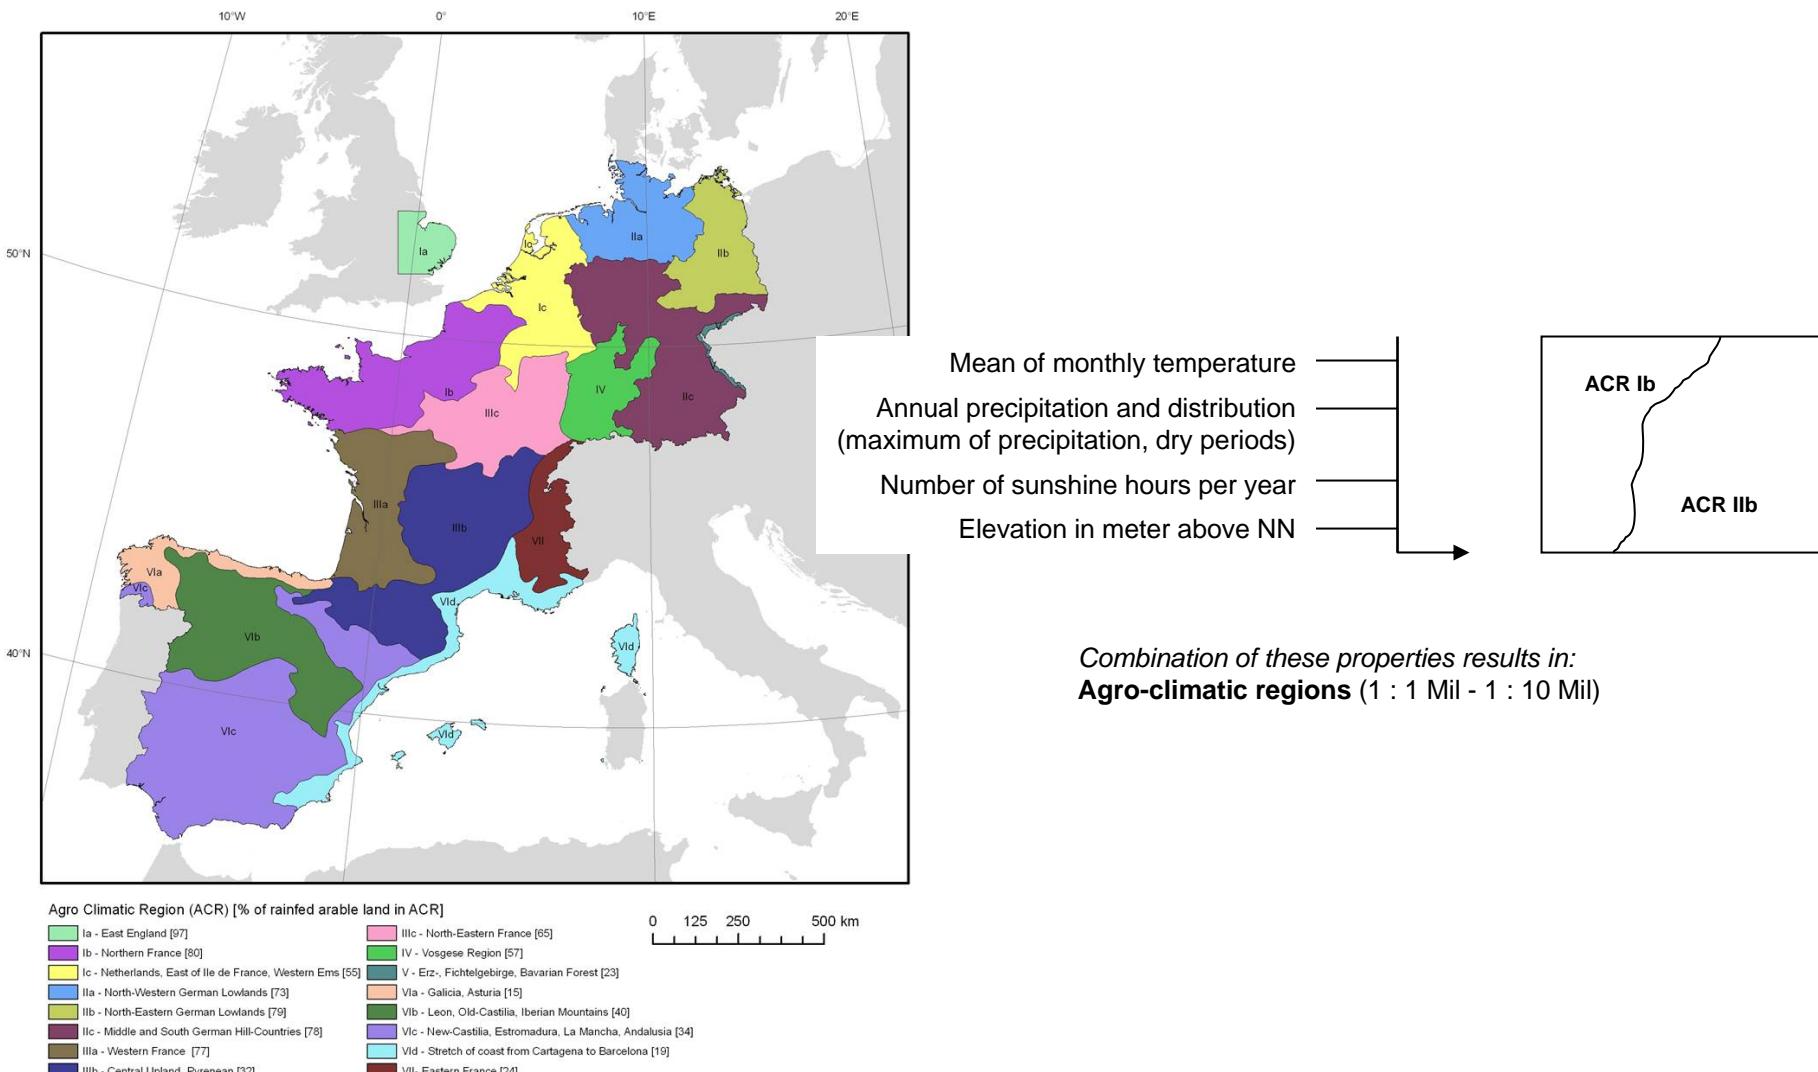

PELCOM, 2000

Combined types of crops derived from monitoring data

Data basis

Agro Climatic Regions (SCHULZKE et al. 1998)

Combined types of crops derived from monitoring data

Methods

Spatial neighbourhood is interpreted as temporal succession

Statistical evaluations + GIS

- Configuration frequency analysis
 - Point density
 - Spatial Correlation
 - Principal component analysis

Validation

Comparision between statistical units NUTSII and point density results

Interpretation

Expert supported interpretation of factors in defined areas

Combined types of crops derived from monitoring data

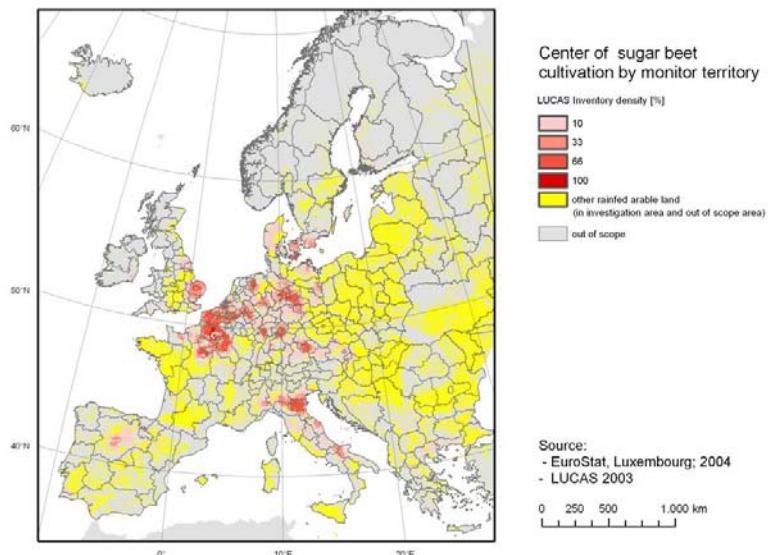

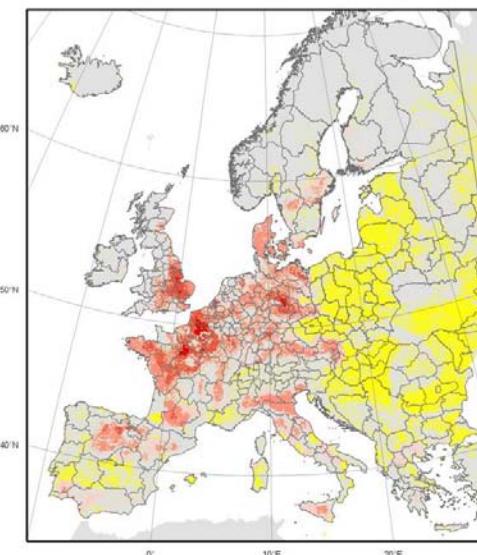

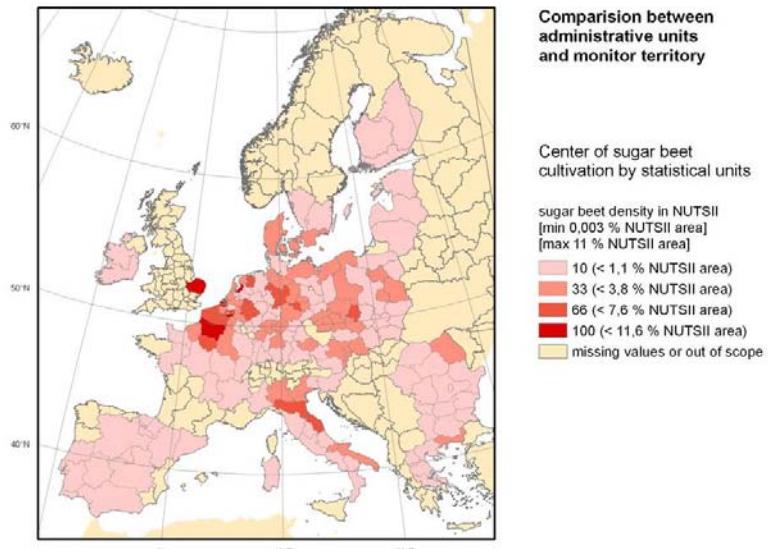

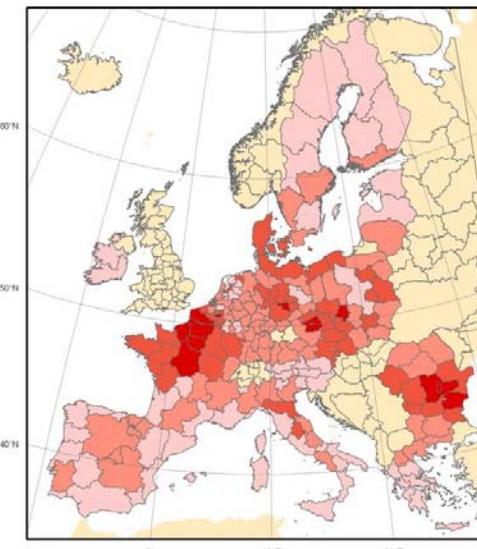

Interim results I

Rank	LUCAS symbol	Crop species
1	B11	Common wheat
2	B16	Maize
3	B13	Barley
4	B12	Durum wheat
5	B32	Rape seeds
6	B22	Sugar beet
7	B50	Temporary artificial pasture
8	B60	Fallow land
9	B31	Sunflower
10	B41	Dry pulses
11	B43	Other fresh vegetables
12	B14	Rye
13	B21	Potatoes
14	B33	Soya
15	B35	Other fibre and oleaginous crops
16	B15	Oats
17	B18	Other cereals
18	B23	Other root crops
19	B37	Other non perm. indust. crops
20	B83	Nurseries (+ fruit tree plantations)

Statistical significance
($\alpha=0,1\%$) between:
– LUCAS crops, and
– PELCOM „rainfed arable land“

Combined types of crops derived from monitoring data

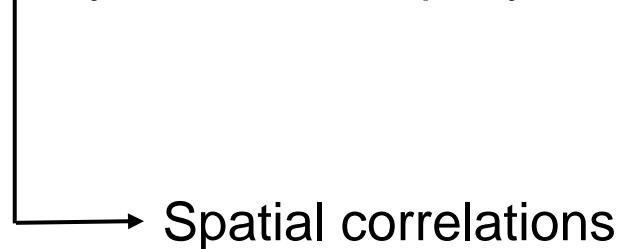

Interim results II

Combined types of crops derived from monitoring data

Interim results III

Overlay between crop layers

Combined types of crops derived from monitoring data

Results – crop combinations

<i>Eigen-value</i>	<i>Crop combinations</i>	<i>Generalized pattern</i>
22	Potatoes – Sugar beet	(II)
16	Common wheat – Sugar beet – Rape seeds	II
14	Temporary artificial pasture – Dry pulses	VIII
7	Dry pulses – Barley	III
6	Oats – Rape seeds	I
5	Other fibre and oleaginous crops – Rye – Rape seeds	I

Example:

North-western German lowlands (ACR IIa)

- each row represents a factor
- selection of crops per factor according to factor load and expert knowledge
- large proportion of rainfed arable land in each ACR can be described with crop combinations
- the approach is spatially-explicit

Combined types of crops derived from monitoring data

Results – generalized pattern of crop combinations

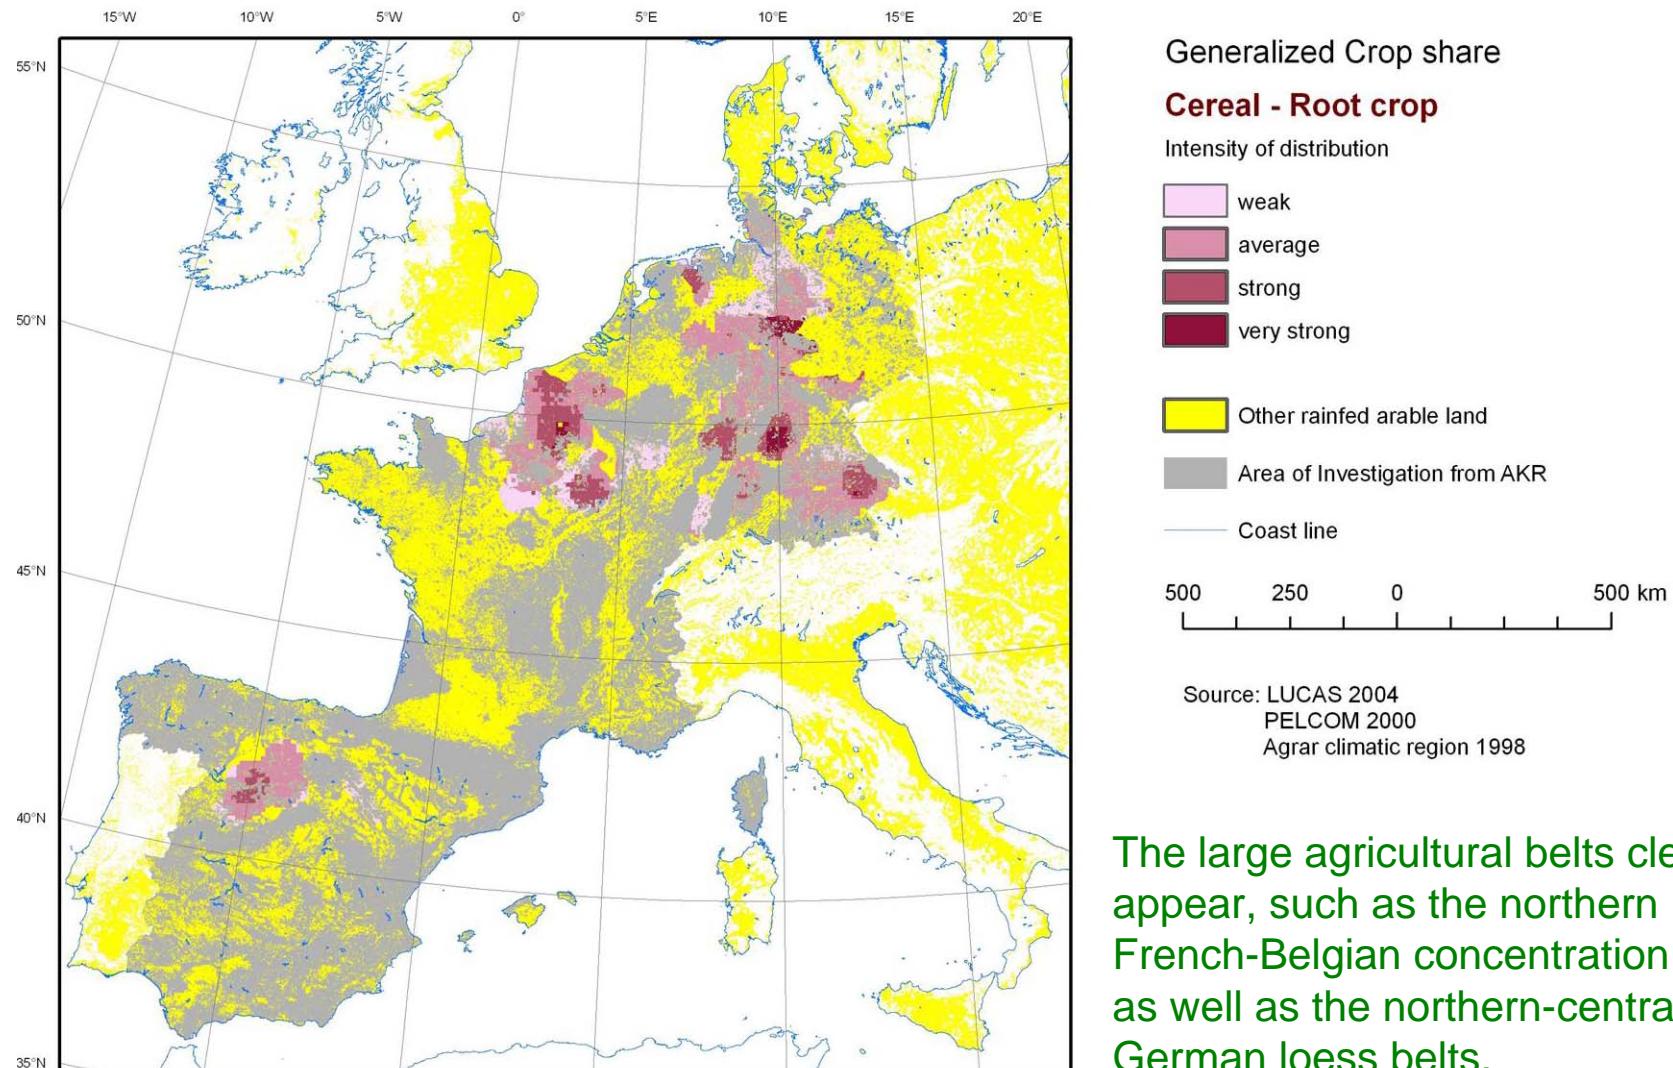

Pattern of „generic“ crop shares

I	- cereal – oleaginous crop	V	- monocultural (maize, sun flower)
II	- cereal – root crops	VI	- fallow land
III	- cereal – pulses }	VII	- special crops
IV	- cereal economy }	VIII	- fodder

- certain crop combinations follow a generic pattern dominated by the most common crops in Europe
- generalisation allows the connectivity of the results beyond administrative boundaries (factors share a common scale)

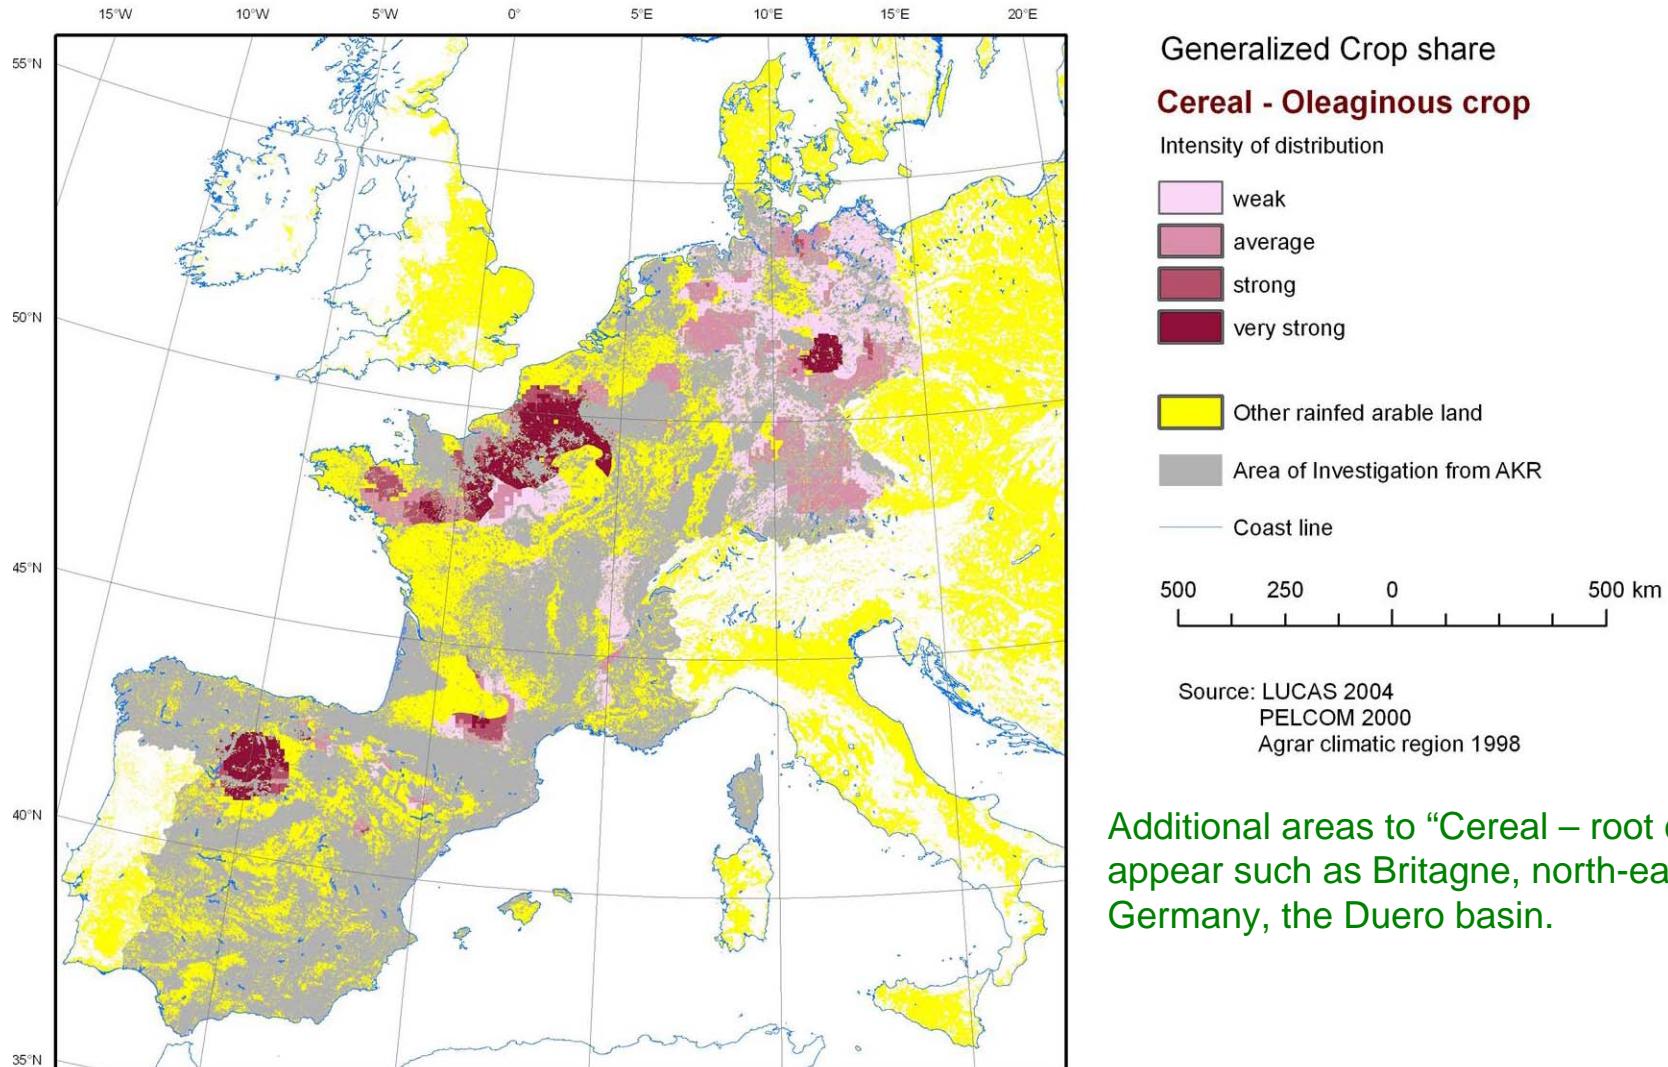

Combined types of crops derived from monitoring data

Results – Generic crop maps

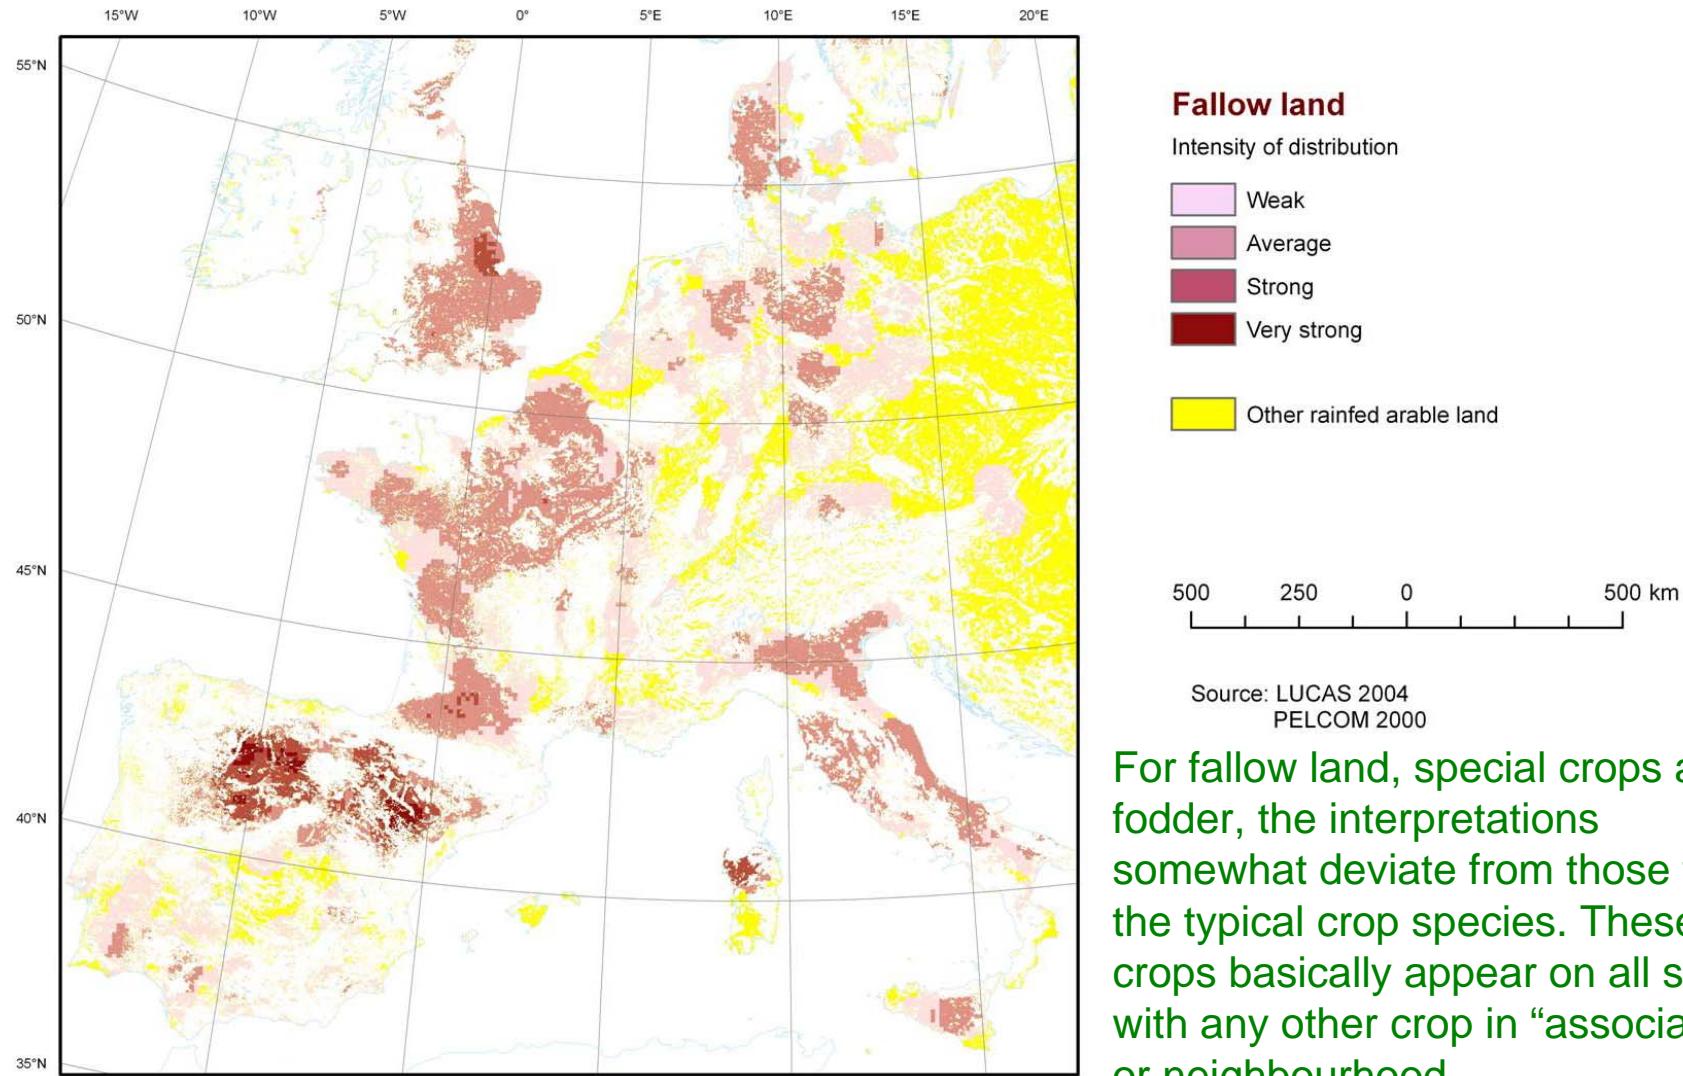

Combined types of crops derived from monitoring data

Results – Generic crop maps

Combined types of crops derived from monitoring data

Results distribution of fallow land in EU 15, intensity of abandoned farmland

Combined types of crops derived from monitoring data

Conclusions

- ✓ first approximation to the spatial mapping of crop species
- ✓ statistical methods combined with expert knowledge to derive regional combination of crops from neighbouring effects in the LUCAS data base
- ✓ crop combinations as crop rotations in the modelling require further validation
- ✓ further stratifications and LUCAS repetition would provide possibilities to substantially improve the reliability
