European soil database and verification of the changes of the organic carbon stock in mineral soils

Vladimir Stolbovoy and Montanarella Luca

Land Management and Natural Hazards Unit, DG Joint Research Center EC

June, 2006

Outline

- European Soil Database
 - Status & relevance
 - Future
- Verification of the changes in carbon stock in mineral soil
 - Area-frame randomized soil sampling
 - Pedological substantialization
 - Field test
- Conclusions

Components of the Soil Database & application to INSEA

SGDBE1M

(Soil Geographical Database of Eurasia at scale 1:1,000,000)

*Polygons/1k raster
Soil mapping units
Soil typological units*

PTRDB

(Pedotransfer Rules Database)

*Bulk density
Sum of base ions*

SPADE

(Soil Profile Analytical Database)

*Base saturation
Cation exchange capacity
Sand content
Silt content
Clay content
Depth to rock
Organic carbon
Package density
Volume of stones*

HYPRES

(Hydraulic Properties)

*Wilting point
Field water capacities
Saturated conductivity
Hydrological soil groups*

STU table

Attribute Name	Confidence Level	Short description
AOLM1	-	Code of the most important limitation to agricultural use of the STU
AOLM2	-	Code of a secondary limitation to agricultural use of the STU
CL	-	Code for a global confidence level of the STU description
FAO95-FULL	yes	Full soil code of the STU from the 1974 (modified CEC 1985) FAO-UNESCO Soil Legend
FAO95-LEV1	yes	Soil major group code of the STU from the 1974 (modified CEC 1985) FAO-UNESCO Soil Legend
FAO95-LEV2	yes	Third level soil code of the STU from the 1974 (modified CEC 1985) FAO-UNESCO Soil Legend
FAO95-LEV3	yes	Third level soil code of the STU from the 1974 (modified CEC 1985) FAO-UNESCO Soil Legend
FAO95-FULL	yes	Full soil code of the STU from the 1980 Soil Legend
FAO95-LEV1	yes	Soil major group code of the STU from the 1980 Soil Legend
FAO95-LEV2	yes	Second level soil code of the STU from the 1980 Soil Legend
L	-	Code for the presence of an impermanent profile of the STU
PAR-MAT-DM	yes	Code for dominant parent material of the STU
PAR-MAT-DM1	yes	Major group code for the dominant parent material of the STU
PAR-MAT-DM2	yes	Second level code for the dominant parent material of the STU
PAR-MAT-DM3	yes	Third level code for the dominant parent material of the STU
PAR-MAT-SEC	yes	Code for secondary parent material of the STU
PAR-MAT-SEC1	yes	Major group code for the secondary parent material of the STU
PAR-MAT-SEC2	yes	Second level code for the secondary parent material of the STU
PAR-MAT-SEC3	yes	Third level code for the secondary parent material of the STU
ROO	-	Depth class of an obstacle to roots within the STU

Based on: John Hollis (http://eussoils.jrc.it/esbn/esbn_meetings_plenary2005.html)

Starting from 2007 (FP7): ESDAC- European Soil Data Centre

EUSIS - A nested soil information system for Europe

Different grid sizes give answers to different questions

Organic carbon is a universal soil quality indicator

(Upcoming Directive for Community action for the protection and sustainable use of soil, based on EC COMMUNICATION (2002, 179))

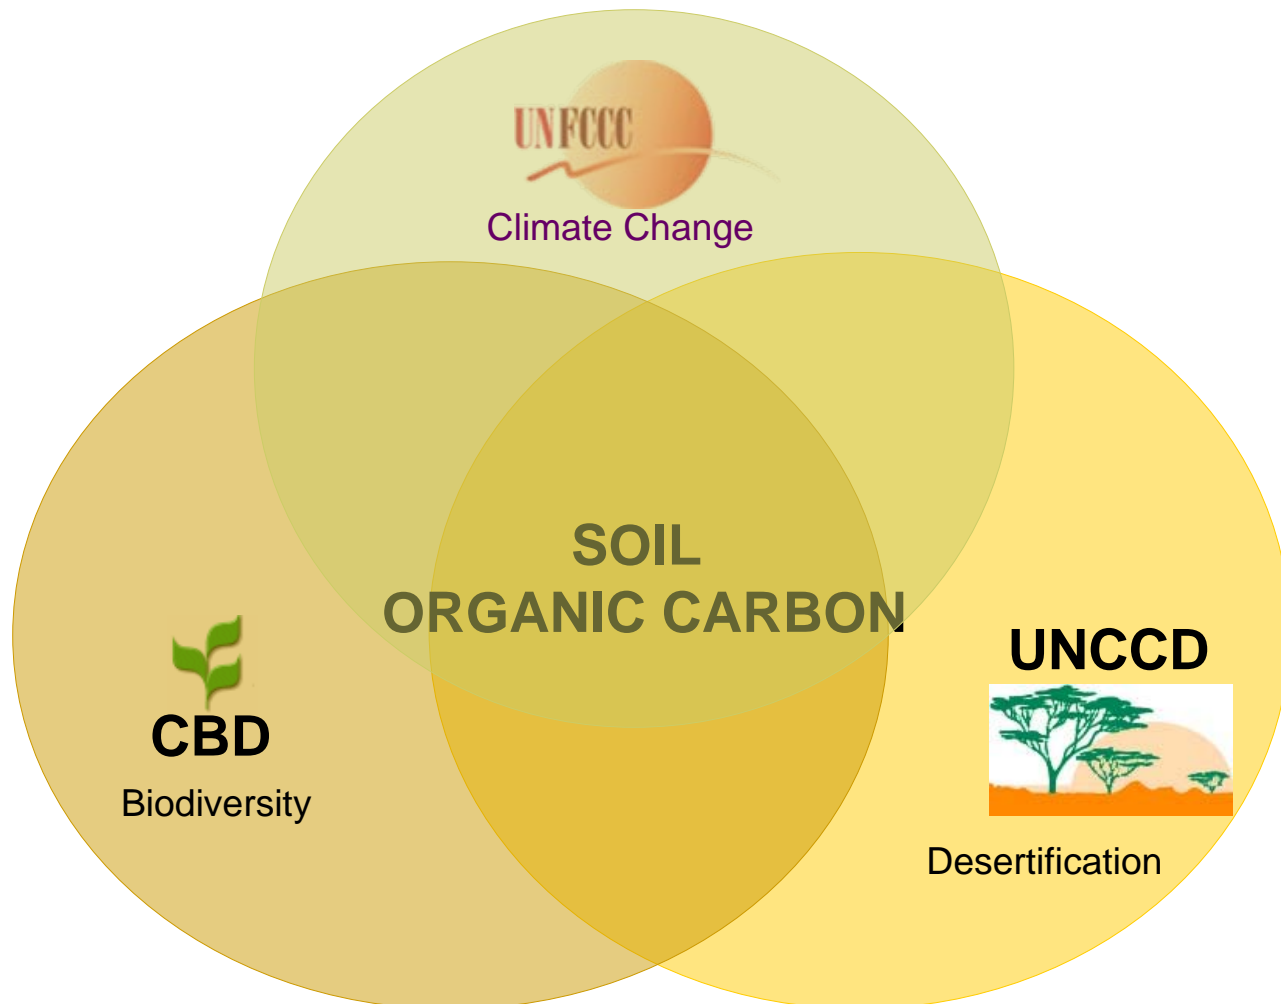

Driver of soil functions:

- Food and other biomass production
- Storing, filtering and transformation
- Habitat and gene pool
- Physical and cultural environment for humankind
- Source of raw materials

Indicator of soil threats:

- Erosion
- Decline in organic matter
- Soil compaction
- Salinisation
- Landslides

Soil organic carbon in global policies: Synergies between the 3 Rio Conventions

Establishing the “Kyoto Soil”

00/1/2 10:51

IPCC solution:

- Stratify soil by land use
- Simply soil to one layer

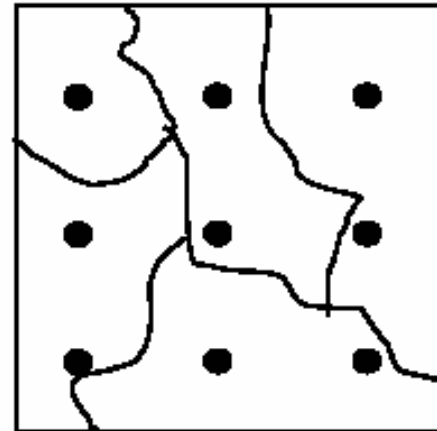

Soil sampling design (based on IPCC GPG, 2003)

Random layout

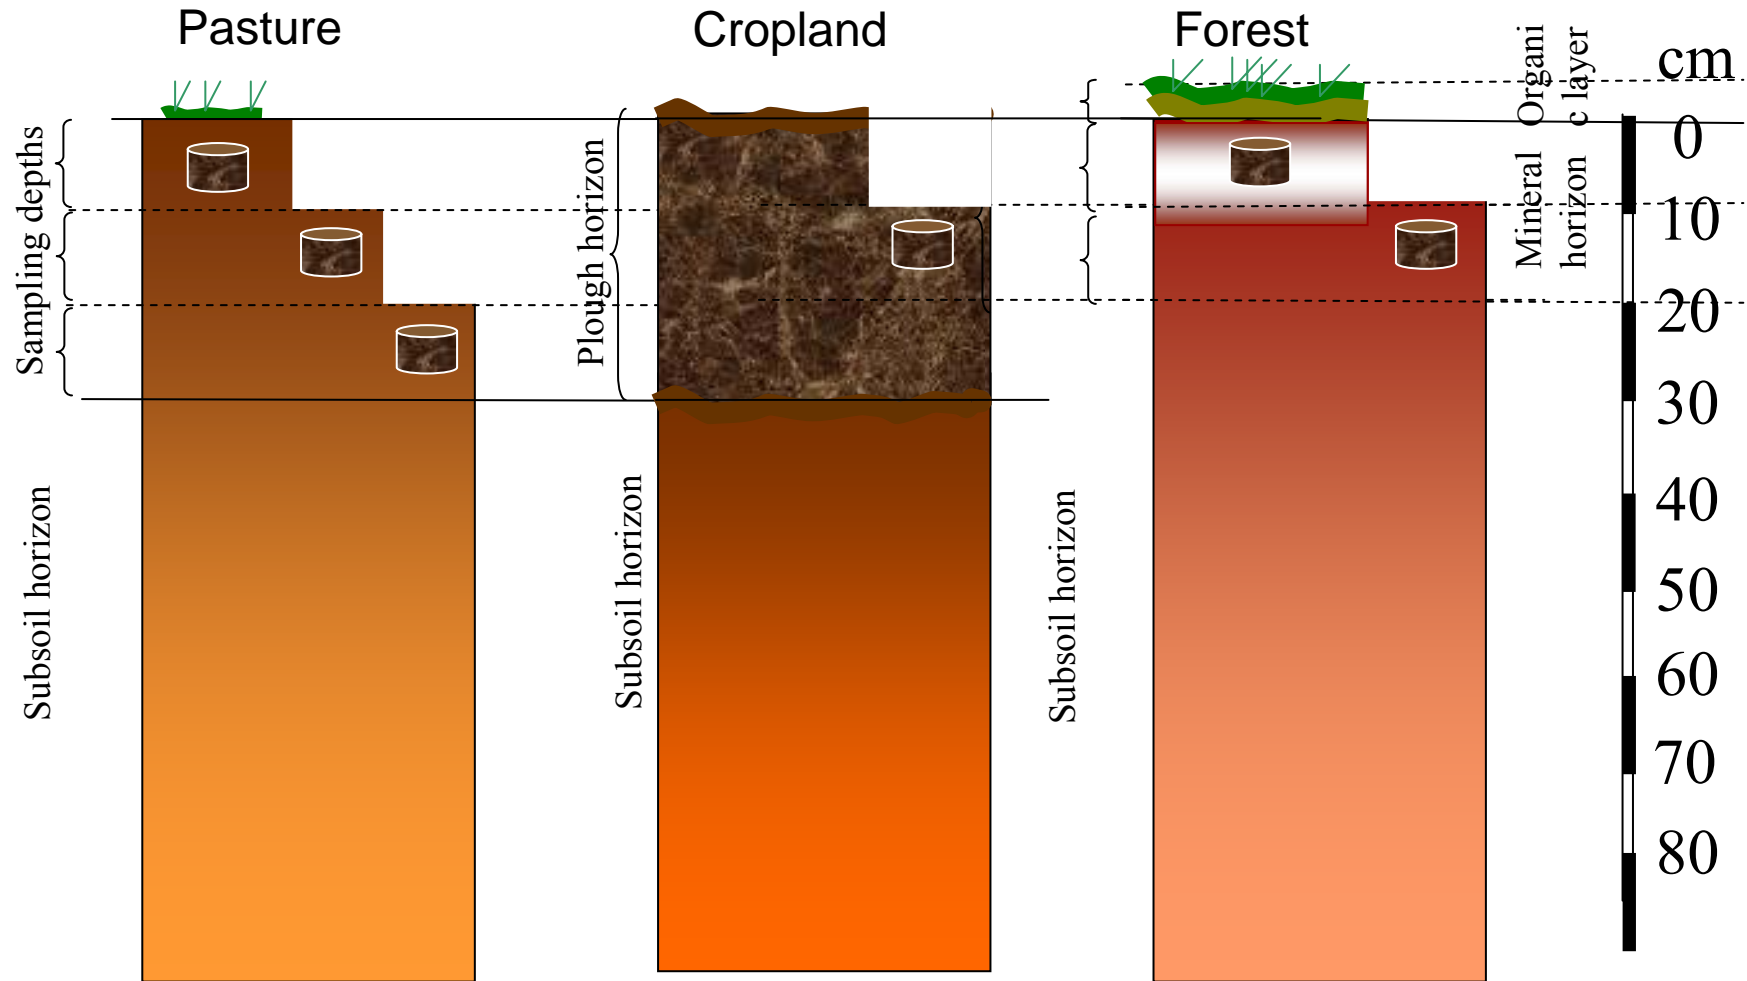

Systematic layout

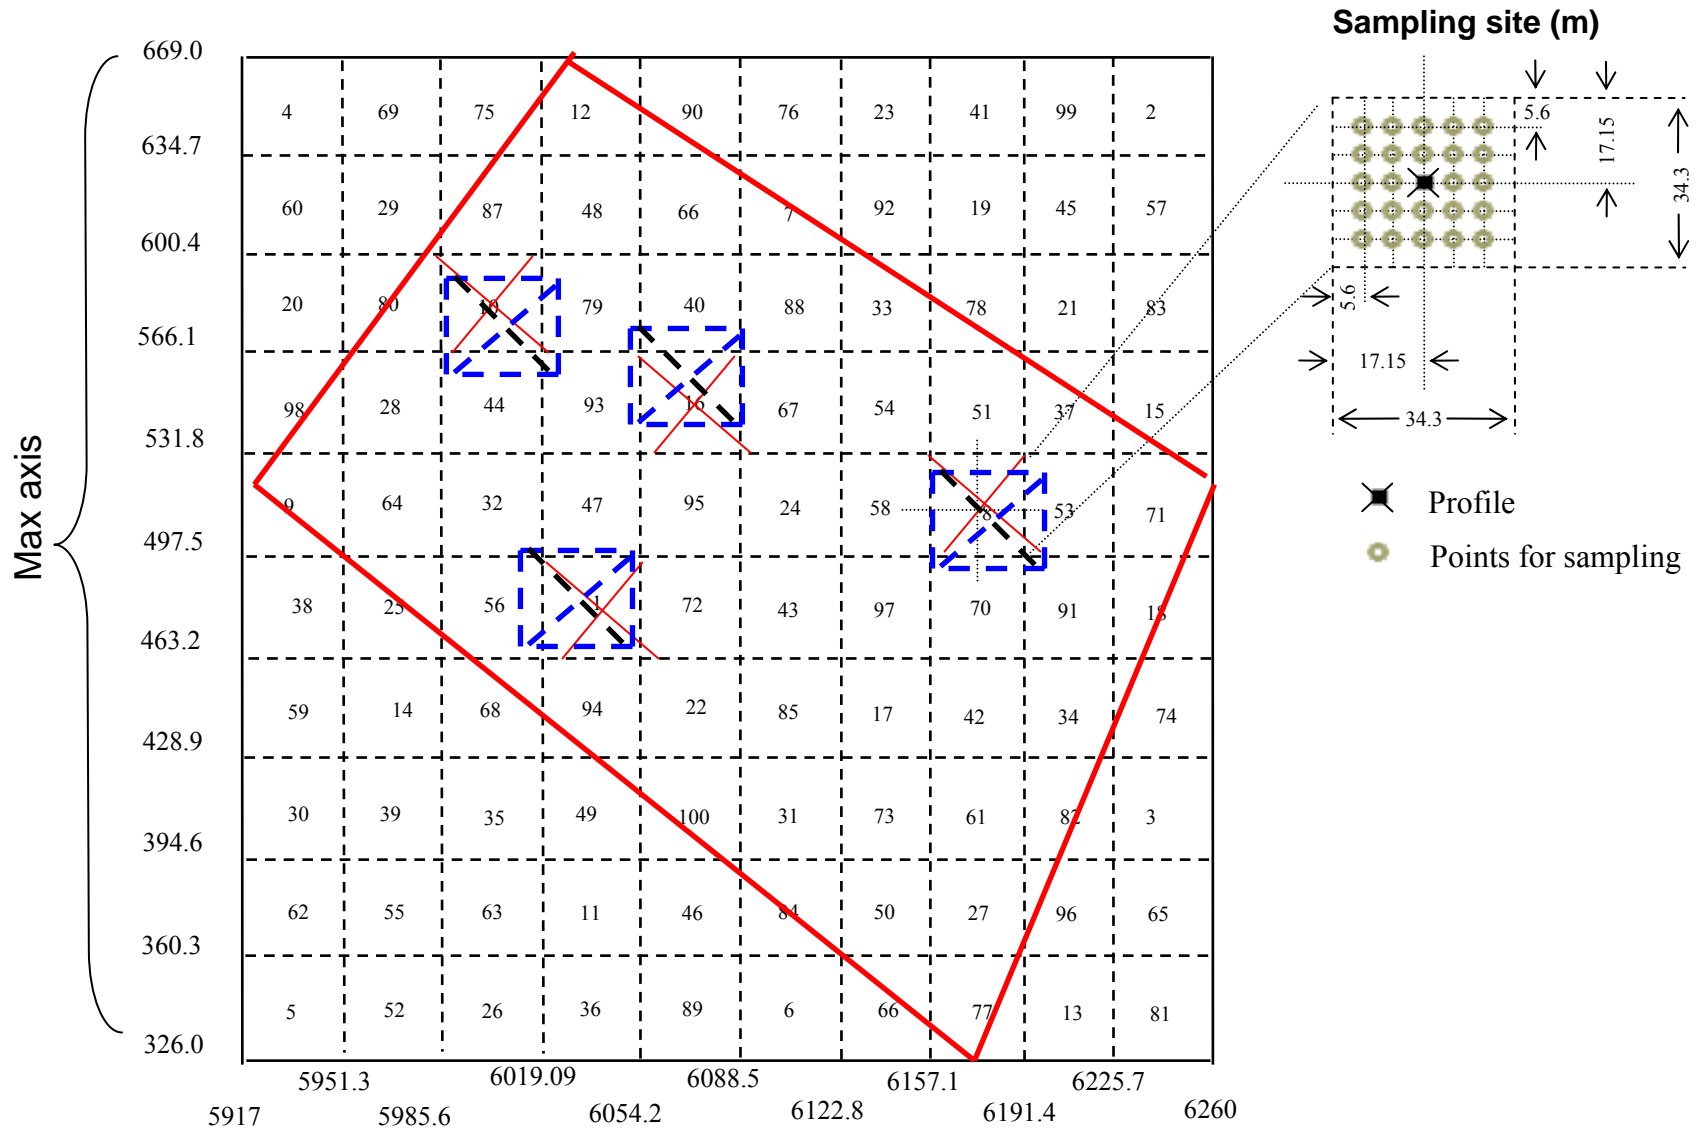

To define baseline C-stock and tackle spatial variability

Sampling substantialization, soil profiles

Randomized template to select sampling sites (simulation of the positioning error: red crosses (first) and blue cells (shifted) samplings)

Computation

Changes in C stock (ΔSOC_{stock}) is a difference between average reference and new measurement

$$\Delta SOC_{stock} = \overline{SOC}_{refstock} - \overline{SOC}_{new}$$

Uncertainty of the verification is characterized by standard error of the changes value $s(\Delta SOC_{stock})$

Changes are verified by:

$$\Delta SOC_{stock} \pm s(\Delta SOC_{stock})$$

Reproducibility (RP) is a difference in the averages resulting from two parallel samplings, which is an error of the sites positioning in the course of the repeated sampling.

$$RP(\%) = \left(\overline{SOC}_{new} / \overline{SOC}_{refstock} \right) * 100$$

Reproducibility: first and second (shifted) samplings

Profile, N	Depth, cm	C, %	Bulk density, g/cm ³	Soil carbon density, kgC/m ³	Carbon content for profile, tC/ha	Soil carbon stock, tC (area 4 ha)	Average soil carbon stock, tC (area 4 ha)	Difference in average carbon stocks between samplings, %
<i>Cropland Skeletic Cambisol, first sampling</i>								
C1S	0-25	2.43	1.29	7.86	n.a.*	314.4		
C22S		2.16	1.43	7.72	n.a.	308.8	301.1	
C8S		2.04	1.37	7.00	n.a.	280.0		
<i>Cropland Skeletic Cambisol, second sampling</i>								3
C1Ss	0-25	1.99	1.52	7.60	n.a.	304.0		
C22Ss		2.00	1.40	7.00	n.a.	280.0	292.0	
C8Ss		1.55	1.25	4.85	n.a.	n.a.		

Source: Stolbovov et al., 2006

Interpretation of the reproducibility

- (1) Detectable minimum: changes bigger than 3 % of the initial C stock can be verified, e.g., if the stock is 70-80 tC/ha for the cropland Skeletic Cambisol the detectable min is 2.1-2.4 tC/ha;
- (2) Selection of land management, e.g., only managements with the potential to gain more than 2.1-2.4 tC/ha can be applied and verified.

The laboratory cost

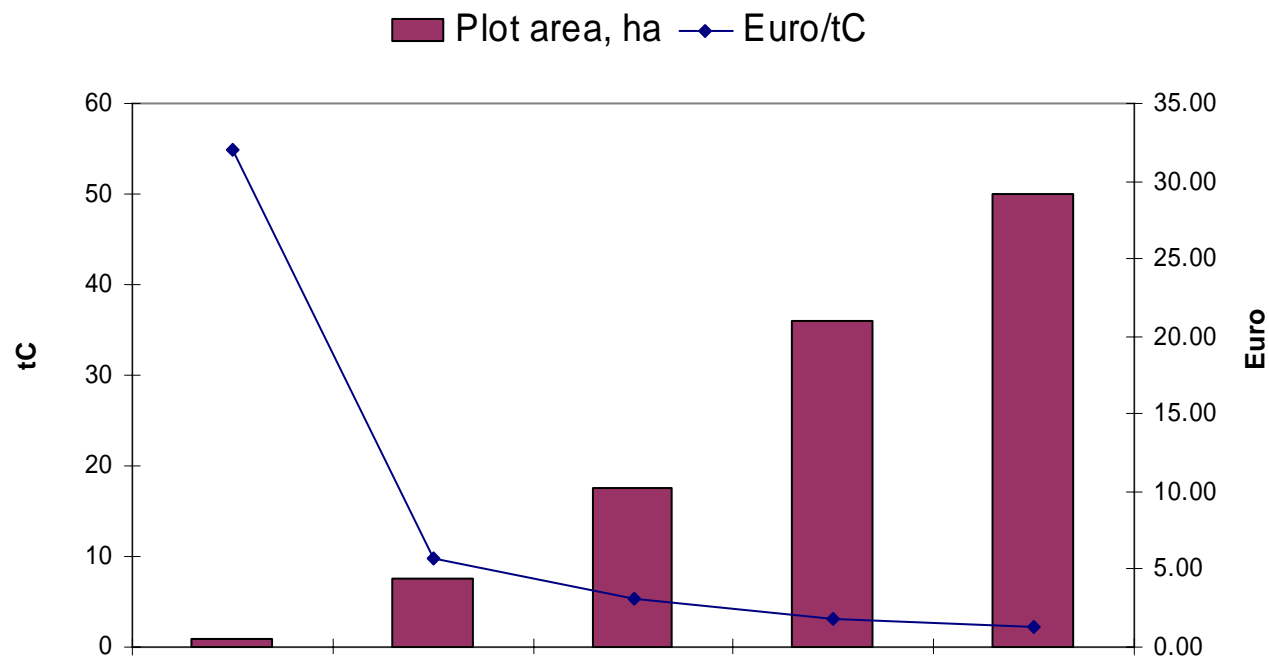

Conditions: the average C sequestration is 6tC (4ha plot); the laboratory cost of the C detection is 16 euro for sample.

Land cover	Conventional (IPCC, 2003)			Area-Frame Randomized Soil Sampling		
	Variability, %	Number of samples	Cost per tC	Variability, %	Number of samples	Cost per tC
Cropland	9	216	576	n.a.	3	8
Pasture	15	300	800	n.a.	9	24

Source: Stolbovoy et al., 2006

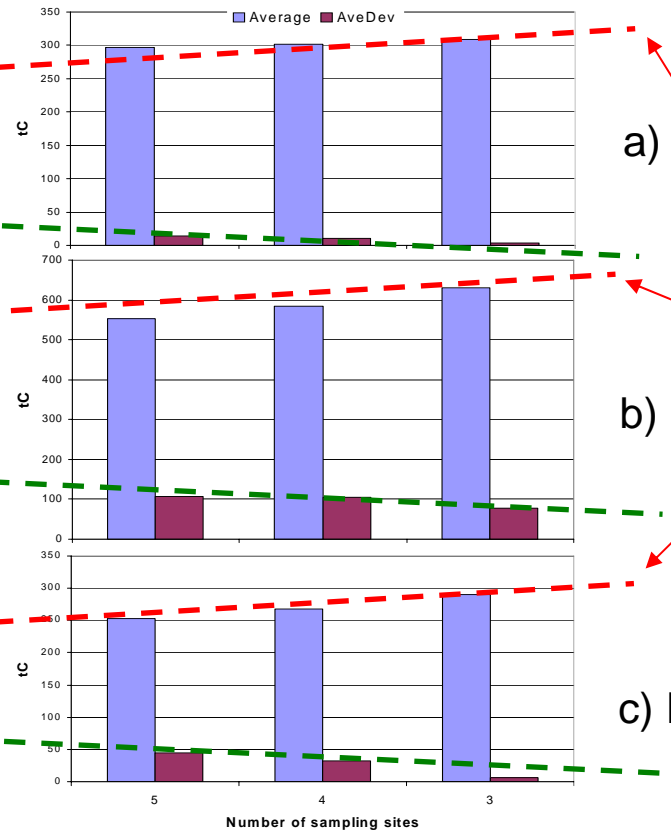

Dependence of the laboratory cost of C determination on the plot area of cropland

Conditions: average carbon sink is 1.5 tC/ha; the cost of lab determination is 16 euro per sample.

Source: Stolbovov et al., 2006

Verification uncertainty: soil carbon stock (Average), average deviation (AveDev)

Decrease of deviation

Increase of C stock

Source: Stolbovov et al., 2006

Conclusions

- ❑ The European Soil Database meets demand of the very detailed biophysical models.
- ❑ The integration with other environment and socioeconomic data (INSPIRE), better soil characterization (European Soil Data Center) contribute to the DB performance in the future.

Conclusions con't

- ❑ A new area-frame randomized soil sampling makes verification simple, transparent and low cost. The method allows easy programming and computation of the sampling procedure.
- ❑ Reproducibility test allows to establish minimum detectable amount of the carbon change and select relevant to this amount carbon management practices.
- ❑ The uncertainty of the detection declines with the soil saturation with carbon, which supports soil implementation for the carbon sequestration.

Thank you
